Albion Advanced Nutrition announces Metalosate® Calcium Boron as the newest product in its line of amino acid chelated micronutrients designed for foliar application. This product is in the Organic Powder category of materials and is a calcium and boron combination material. It contains 13% calcium and 5% boron.

This product is approved for use in organic production under the guidelines set forth by the USDA in the National Organic Program (NOP).

In the February 2007 Metalosate Plant Nutrition Newsletter the critical relationship between calcium and boron was discussed. This product will enable growers to apply these two closely related plant nutrients at the same time in a convenient combination material.

The material is available in 4.4-lb (2-kg) plastic containers. The recommended application rate is 14 oz. (400 g) per acre or 1 kg per hectare. This equates to 5 acres or 2 hectares per bottle at this rate.

Given the unique combination of calcium and boron in this material, we see it being used in organic production schemes as well as conventional production.

This product promises to be another effective tool to be utilized in producing superior crops.

Please consult your local Albion Representative for further information on this or any other Albion Metalosate product.
